				IRM		IRM	IRM
Great Bittern <i>Botaurus stellaris</i>	Roerdomp Rohrdommel			CR	(-)	(-)	(-)

¹ For each bird species, there are two rows: the first one gives the status of threat for breeding birds, the second one the importance of the area for migratory species.

In the first row, statements are only made if the species concerned is threatened or extinct in at least one of the four subregions, or if this species fulfills the criteria of 'International responsibility for resident species'. In the second row, statements are only made if the species concerned fulfill the criteria of 'International responsibility for migratory species'.

Some species are threatened in the Dutch part of the Wadden Sea area and may occur as breeding birds in the German and Danish parts but do not breed there in typical coastal habitats of natural origin. For them no trilateral status of threat is given.

* Lack of reliable information in general, therefore only preliminary evaluations are given.

Legend

Categories regarding the status of threat (see definition in the general introduction):

EX: extinct;

CR: critical;

EN: endangered;

VU: vulnerable;

SU: susceptible;

IR: international responsibility:

IRR: for resident species: number of breeding birds: at least 5% of the north-west-European breeding population;

IRM: for migratory species: number of migrating birds: at least 1% of the biogeographical population uses the Wadden Sea area during migration, wintering and summering.

Additional symbols concerning breeding status:

-: species is not a breeding bird in this subregion of the Wadden Sea; however, the species may occur as a winter or summer visitor or as a migrant;

(-): species is not considered for this subregion of the Wadden Sea, because its main distribution lies outside the considered area of the Wadden Sea due to the fact that:

- species occurs in adjacent freshwater marsh areas behind the dikes and occasionally occurs in smaller numbers in the area considered, or

- species occurs in freshwater or terrestrial habitats on the Wadden Sea islands;

*: species is not endangered as a breeding bird in this subregion of the Wadden Sea and is not an established newcomer;

??: status of the species is not known in this subregion of the Wadden Sea.

Additional symbols concerning migratory status:

+: number of migrating birds: less than 1% of the biogeographical population uses the Wadden Sea area during migration, wintering and/or summering;

??: status is not known in this subregion of the Wadden Sea.

Symbols concerning threats:

AFF= afforestation; AGR= agriculture; CLI= climatic change; DIS= disturbance; EUT= eutrophication;

EXL= exploitation of living resources; EXM= mineral exploitation; FOR= forestry; HAB= loss of habitat;

PAR= parasites; POL= pollution; WAT= water regulation.

For more detailed descriptions see the general introduction to the Red Lists.

¹ Since 1993, 100% of the north-west-European population of the Gull-billed Tern has been breeding in the Wadden Sea area.

Fig. 1. Percentage of the north-west-European population breeding in the entire Wadden Sea 1991 (after Fleet et al., 1994);
A further 6 species reach at least the 1%-level.

Fig. 2. Percentage of the biogeographical population using the entire Wadden Sea area and the 3 sm-coastal waters during migration (resting, wintering, summering, moulting) (after Meltofte et al., 1994; Rösner et al., 1994).

Furthermore, at least 3 passerine-species, Horned Lark, Twite and Snow Bunting, reach the 1%-level; however, exact numbers are unknown; 10-12 other species, which are not so typical for the area, reach this level especially in the Dutch part of the Wadden Sea, e.g. some diving ducks, Little Gull and Black Tern.

LIST OF THREATENED BIOTOPES AND BIOTOPES COMPLEXES OF THE WADDEN SEA AREA

Part I: Biotope-Complex types																	
	Code: (NL)	Biotope type	OE	Status of threat in the subregions of the Wadden Sea Area						RE	Main biotope types	Main Threats	Habitat Directive				
				NL		D		DK
